| Methods | <p>Study design: Randomized controlled trial</p> <p>Study grouping: Parallel group</p> |
| Participants | <p>Baseline Characteristics</p> <p>Intervention</p> <ul style="list-style-type: none"> ● <i>Mean age, years (SD):</i> 38.5 (11.0) ● <i>Female %:</i> 73% ● <i>Mean years since onset (SD):</i> 11.9 (6.0) <p>Control</p> <ul style="list-style-type: none"> ● <i>Mean age, years (SD):</i> 37.4 (6.1) ● <i>Female %:</i> 63% ● <i>Mean years since onset (SD):</i> 8.8 (4.0) <p>Included criteria: Participants were selected by an in-person Structured clinical interview for DSM-IV interview (SCID; First, Gibbon, Spitzer, & Williams, 1997). To be included in the study, participants had to meet the following criteria: fulfill the DSM-IV (American Psychiatric Association, 1994) criteria for PD; PD duration of at least 1 year; age between 18 and 60 years; not suffering from any other psychiatric disorder in immediate need of treatment; have a depression point total on the self-rated version of the Montgomery-Åsberg Depression Rating Scale (MADRS-SR; Svanborg & Åsberg, 1994) of less than 21 points and less than 4 points on the suicide question (Item 9); PD as the primary problem; at least one full-blown panic attack or one limited symptom attack during the pre-treatment baseline (a limited symptom attack is an attack that meets all other criteria but has fewer than four somatic or cognitive symptoms.); if on prescribed drugs for PD, (a) the dosage had to be constant for 3 months before the start of the treatment, and (b) the patient had to agree to keep the dosage constant throughout the study; if in therapy, this had to have been ongoing for more than 6 months and not be of CBT type; previous contact with a physician, psychologist, or other health professional as a consequence of panic attacks; no epilepsy, kidney problems, strokes, organic brain syndrome, emphysema, heart disorders, or chronic high blood pressure.</p> <p>Pre-treatment: The two groups did not differ significantly in any of the measurements at pre-treatment.</p> |
| Interventions | <p>Intervention Characteristics</p> <p>Intervention</p> <ul style="list-style-type: none"> ● <i>Description:</i> Internet-administered self-help program consisting of Applied Relaxation in the AR group. Ost's applied relaxation book (Ost, 1997) was adapted for self-help use via the WWW. A compact Internet-administered disc (CD) with three relaxation instructions was also sent to the participants. The treatment was divided into 9 modules: (1) psychoeducation, (2) rational, (3) psychoeducation, (3) progressive muscle relaxation: long version, (4) |

| | |
|------------------------|---|
| | <p>progressive muscle relaxation: short version, (5) conditioned relaxation, (6) differential relaxation, (7) quick relaxation, (8) applied relaxation, and (9) relapse prevention. Participants with a cellular phone (n=5) were sent short message service (SMS) reminders to relax about twice every weekday.</p> <ul style="list-style-type: none"> ● Dose: The mean total time spent by the therapist each participant was approximately 30 min, including administration, and responding to the e-mails. Most answers were fully standardized. Often only the participants name was altered in the greeting phrase of the e-mails. ● Duration: 9 modules (from May to December). Participants accessed to the first treatment module at the end of May 2001. They were expected to read the material and do the exercises described in the modules. No time limit was set for completing each module. An e-mail message to inquire how work with the current module was progressing was sent out once in September 2001. Post-treatment assessment was conducted in December 2001. Each module ended with five to eight questions. Participants were asked to explain, in their own words, the most important sections of the module they had just completed. The questions were intended to encourage learning and to enable the research supervisors to assess whether the participants had assimilated the material, and finished their homework. Standardized feedback was given within 7 days of the participants sending their answers via e-mail. On the basis of these e-mails, an assessment was made of whether the participant was ready to continue, if so, the password to the next module was sent. If not, the participant received instructions on what needed to be completed before proceeding to the next step. <p>Control</p> <ul style="list-style-type: none"> ● Description: Internet-administrated self-help program consisting of CBT. The main treatment component in the CBT group was a self-help manual that was adapted for use via the WWW, and to be suitable for Swedish conditions. It consisted of 197 pages of text and exercises divided into 6 modules: (1) psychoeducation, (2) breathing retraining, (3) cognitive restructuring, (4) interoceptive exposure, (5) exposure in vivo, (6) relapse prevention and (7) assertiveness training (for details see Carlbirngret al., 2001). ● Dose: The mean total time spent by the therapist on each participant was approximately 30 min, including administration, and responding to the e-mails. Most answers were fully standardized. Often only the participants name was altered in the greeting phrase of the e-mails. ● Duration: 6 modules (from May to December). Participants accessed to the first treatment module at the end of May 2001. They were expected to read the material and do the exercises described in the modules. No time limit was set for completing each module. An e-mail message to inquire how work with the current module was progressing was sent out once in September 2001. Post-treatment assessment was conducted in December 2001. Each module ended with five to eight questions. Participants were asked to explain, in their own words, the most important sections of the module they had just completed. The questions were intended to encourage learning and to enable the research supervisors to assess whether the participants had assimilated the material, and finished their homework. Risk of bias table

| Bias | Authors' judgement | Support for judgement |
|---|--------------------|--|
| Random sequence generation (selection bias) | Unclear risk | Judgement Comment: Insufficient information on sequence generation. |
| Allocation concealment (selection bias) | Unclear risk | Judgement Comment: Insufficient information on allocation concealment. |
| Blinding of participants and personnel (performance bias) | High risk | Judgement Comment: No information of blinding of participants, blinding not feasible. the intervention was an internet administered self help program. The participants were given standard feedback on questions at each module. No information of blinding of the personnel which delivered the feedback. Blinding not feasible, and outcomes are self-reported. |
| Blinding of outcome assessment (detection bias) | High risk | Judgement Comment: Blinding not feasible, and outcomes are self-reported. |
| Incomplete outcome data (attrition bias) | Low risk | Quote: "the statistical analysis, preassessment data for applicants who were allocated to one of the two study groupings but who did not complete the treatment were brought forward and used as postassessment data (n=5). This was done on the basis of an intention-to-treat evaluation of the results, which is a more conservative approach compared to only including those who completed the treatment". Judgement Comment: 3 dropouts in th CBT group and 2 in the AR group. Intention to treat analysis. |
| Selective reporting (reporting bias) | Low risk | Quote: "The study protocol was approved by the ethics committee at Uppsala University." Judgement Comment: The protocol not available. The study seems to report on all the outcomes stated in the methods section. |

| | |
|-------------------|--|
| Other bias | <p>Low risk</p> <p>Quote: "This study was sponsored by grants from the Swedish Foundation for Health Care Sciences and Allergy Research, the Böethius Foundation, the Swedish Council for Research in the Humanities and Social Sciences, and the S. oderstr. om-K. oniska Foundation. We thank Per Forslin and Carola Strandlund for the SCID-interviews." Judgement Comment: The study appears to be free from other sources of bias.</p> |

| | <p>were not a reason for exclusion. Pretreatment: There were no significant differences between the groups in comorbidity.</p> <p>Intervention Characteristics Intervention</p> <ul style="list-style-type: none"> ● Description: Exposure and applied relaxation. EXP and AR was based on the EXP described by Butler (1985) and the AR training described by Öst (1987). Throughout treatment, therapy sessions included exposure exercises and relaxation training, each of which was also included in weekly homework assignments. Exposure was presented in the context of a habituation rationale. Hierarchies were constructed, and patients were encouraged to progress up their hierarchy in a relatively rapid manner that also helped build their confidence. As advocated by Butler (1985), considerable attention was paid to in-situation (subtle) avoidance, with patients being encouraged to reverse in-situation avoidance and to enter situations they would normally avoid. In-session exposure focused on in vivo exercises, rather than role-plays with the therapist. Training in AR was presented as an anxiety management procedure. It was explained that strong physical reactions in feared situations are a major contributor to patients' social fears and that the training had been specifically developed to deal with these reactions. In the original AR protocol, exposure is not introduced until after the relaxation techniques have been fully mastered. We deviated from this practice by using exposure exercises throughout treatment. However, as advocated by Öst (1987), patients were instructed to refrain from using their newly acquired relaxation techniques in phobic situations until they had completed all the steps in the relaxation training program (around Session 10). ● Dose: In both CT and EXPAR, sessions typically lasted 90 min. The relaxation training component of EXPAR took approximately 20 min. weekly sessions. Treatment consisted of 14 weekly sessions and up to 3 booster sessions were given in the first 3 months of follow-up, after which no further treatment was offered. ● Duration: 14 weeks <p>Control</p> <ul style="list-style-type: none"> ● Description: Cognitive therapy (CT). CT was essentially the same as in Clark et al. (2003). A variety of procedures, which are described in a manual (Clark, 1997) and elsewhere (Clark, 2001; Wells, 1997, pp. 167-199), were used to reverse the maintaining factors identified in Clark and Wells's (1995) model of social phobia. This model provides a similar account of maintenance to that proposed by Rapee and Heimberg (1997). Although overlapping in some respects with other empirically validated CBT programs, CT has several distinctive features. These include the following: (a) the development of version of Clark & Wells (1995) model by using the patient's own thoughts, images, attentional strategies, safety behaviors, and symptoms; (b) experiential exercises in which self-focused attention and safety behaviors are systematically manipulated in order to demonstrate their adverse effects; (c) systematic training in externally focused attention with practice in nonsocial and social situations; (d) techniques for restructuring distorted self-imagery, including a specialized way of using video feedback (see Harvey, Clark, Ehlers, & Rapee, 2000); (e) surveys to collect data on other peoples beliefs about such issues as blushing and trembling; and (f) the structuring of planned confrontation with feared social situations as a behavioral experiment in which patients test pre-specified negative predictions while dropping their habitual safety behaviors and focusing externally. A habituation rationale was not used, and repeated exposure to the same situation was not encouraged. Unlike some CBT programs, patients were not encouraged to develop positive self-talk before or during social situations, and there was no formal social skills training. ● Dose: In both CT and EXPAR, sessions typically lasted 90 min. weekly sessions. Treatment consisted of up to 14 weekly sessions and up to 3 booster sessions were given in the first 3 months of follow-up, after which no further treatment was offered. ● Duration: 14 weeks |
| <p>Outcomes</p> | <p><i>Funktion, The Social Interaction Scale (SIAS), mean, SD</i></p> <ul style="list-style-type: none"> ● Outcome type: Continuous Outcome ● Reporting: Fully reported ● Scale: The Social Interaction Scale (SIAS) ● Range: 0-80 ● Direction: Lower is better ● Data value: Endpoint |

| Other bias | Low risk | Judgement Comment: The study appears to be free from other sources of bias |

Dermyer 2009

| | |
|----------------|---|
| Methods | <p>Study design: Randomized controlled trial Study grouping: Crossover</p> |
|----------------|---|

| | |
|-----------------------------|---|
| <p>Participants</p> | <p>Baseline Characteristics</p> <p>Intervention</p> <ul style="list-style-type: none"> ● Female %: 15 (88.24%) <p>Control 2</p> <ul style="list-style-type: none"> ● Female %: 13 (81.25%) <p>Overall</p> <ul style="list-style-type: none"> ● Female %: 28 (84.85%) <p>Included criteria: To be included in the study, volunteers had to be adults over the age of 18. Volunteers also had to have a prior diagnosis of GAD made by a physician or mental health practitioner. Prospective participants were required to obtain a referral from a physician or mental health practitioner to participate in the study. Additionally, the participants were required to document general health information to identify factors that may have confounded the analysis. Participants also needed to have the capacity and willingness to fill out psychological tests.</p> <p>Excluded criteria: Including reasons for exclusion: An initial screening took place using the Generalized Anxiety Disorder Questionnaire-IV (GADQ-IV; Appendix H) to substantiate GAD diagnoses made by a physician or mental health practitioner in regard to the participant referrals. If there were discrepancies between the referral and the diagnostic test score, the volunteer was excluded from the study. Four potential participants were excluded from this study for this reason. Volunteers also were excluded from the study if they had practiced yoga regularly (once a week) in the past 3 months. In this instance, no participants were excluded for this reason. Additionally, individuals diagnosed with a severe psychiatric illness were unable to participate. There were no such individuals who volunteered for this research study.</p> <p>Pretreatment: NI however, a t-test was conducted by the statistical consultant to confirm that the randomization process was effective and that both the experimental and wait-list control groups were equivalent at baseline.</p> |
| <p>Interventions</p> | <p>Intervention Characteristics</p> <p>Intervention</p> <ul style="list-style-type: none"> ● Description: The Fu-ZEN D²™ Yoga-Stretch Program Protocol: Participants in the experimental group received the Fu-ZEN D²™ Yoga-Stretch Program intervention during a 1-month period. Research participants receiving the mind-body intervention met three days a week (Sunday, Tuesday, and Thursday) for one month at the City of Marquette Arts and Culture Center in the Peter White Public Library. The researcher logged attendance. The participants practiced the Fu-ZEN D²™ Yoga-Stretch Program for one hour, three days a week, at the same pre-set evening time. The researcher, who was also the originator of the program, led instruction of the exercises. The researcher has performed the Fu-ZEN D²™ Yoga-Stretch Program twice a day, every day, for over 14 years, in addition to practicing other various forms of yoga. The focus of the Fu-ZEN D²™ Yoga-Stretch Program is stretching, flexibility, strength, balance, breathing, mindfulness, non-sectarian spirituality, and relaxation. Each posture was held for a minimum of 30 seconds. Virtually every muscle in the body was targeted. The exercise sessions began and ended with warm-up and cooldown exercises. For cost efficiency, traditional yoga props such as blocks and belts were not used in this study. However, the absence of these props was not a deterrent to growth and progress in this program. The temperature of the room was kept at 70 degrees. ● Dose: One hour, three times per week ● Duration: 1 month. <p>Control</p> <ul style="list-style-type: none"> ● Description: During the initial month, participants in the wait-list control group went home and carried on normally with their lives. ● Duration: 1 month |

| | |

| <p>Methods</p> | <p>Study design: Randomized controlled trial</p> <p>Study grouping: Parallel group</p> |
| <p>Participants</p> | <p>Baseline Characteristics</p> <p>Overall</p> <ul style="list-style-type: none"> ● Mean age, years (SD): 38.5 (12.0) ● Female %: 66.2% <p>Included criteria:</p> <p>Inclusion criteria were: (a) a primary diagnosis of GAD with a Clinician's Severity Rating of at least 4/8 (moderate severity); (b) a difference of at least 2 points on the Clinician's Severity Rating between GAD and all comorbid conditions; (c) between 18 and 64 years of age; (d) no change in medication type or dose during 4 to 12 weeks before assessment (4 weeks for benzodiazepines, 12 weeks for antidepressants and hypnotics); (e) willingness to keep medication stable during the treatment phase of the study (no change in medication type or increase in dose); (f) no evidence of suicidal intent; (g) no evidence of current substance abuse; and (h) no evidence of current or past schizophrenia, bipolar disorder, or organic mental disorder.</p> <p>Pretreatment: No between-group differences were found for demographic variables.</p> |
| <p>Interventions</p> | <p>Intervention Characteristics</p> <p>Intervention</p> <ul style="list-style-type: none"> ● Description: Applied relaxation. Covered the following treatment phases. 1. Psychoeducation and tension awareness training (1 session). During the first phase of treatment, the therapist explained that the goal of AR was to learn to recognize muscle tension and to apply relaxation methods, thereby reducing overall levels of tension, anxiety, and worry. Patients also learned to monitor their levels of muscle tension on a daily basis. 2. Tension-release training (4 sessions). Patients learned to tense then relax different muscle groups (moving from 16 to 4 muscle groups) until full relaxation was achieved. 3. Relaxation by recall (2 sessions). Once the tension-relaxation procedure with 4 muscle groups had been mastered, patients learned to relax their muscles without tensing them first. 4. Relaxation by counting (1 session). At the end of sessions when patients had achieved full relaxation through recall alone, the therapist slowly counted from 1 to 10, asking patients to imagine their relaxation becoming even deeper. Once the patients had successfully integrated the counting into the recall procedure, they learned to relax by counting alone. 5. Conditioned relaxation (3 sessions): In this phase of treatment, patients learned to apply relaxation skills in everyday situations using a graded hierarchy. This enabled them to achieve relaxation in response to a self-produced cue (e.g., by counting to 10) in real-life stressful situations. For a detailed description, see Bernstein and Borkovec (1973) and Öst (1987). ● Dose: Consisted of 12 weekly 1-hour therapy sessions. ● Duration: 12 weeks. <p>Control</p> <ul style="list-style-type: none"> ● Description: CBT Cognitive-behavioral therapy. Covered the following treatment phases. 1. Psychoeducation and worry awareness training (1 session). The therapist first explained that the goal of CBT was to learn to recognize and reduce worry, thereby decreasing overall levels of worry, anxiety, and tension. Patients learned to monitor their worrying on a day-to-day basis, and to distinguish between worries about current problems (e.g., meeting deadlines at work) and worries about hypothetical situations (e.g., being involved in an accident). 2. Uncertainty recognition and behavioral exposure (3 sessions). The therapist then helped patients to understand the role of intolerance of uncertainty in |

|------------------------------|---|
| | <p>worry and anxiety, to realize that uncertainty-inducing situations are largely unavoidable, to recognize the various manifestations of intolerance of uncertainty, and to seek out and experience uncertainty-inducing situations. 3. Reevaluation of the usefulness of worry (1 session). In the next phase, patients learned to identify and reevaluate their positive beliefs about worry (e.g. "my worries prepare me for bad things that might happen") using strategies such as the lawyer-prosecutor role play. 4. Problem-solving training (3 sessions). Patients then learned to address worries about current problems by using a problem-solving procedure targeting problem orientation, problem definition and goal formulation, generation of alternative solutions, decision making, and solution implementation and verification (See D'Zurilla, 1986). 5. Imaginal exposure (3 sessions). Finally, patients learned to use imaginal exposure for worries about hypothetical situations. With the help of the therapist, patients developed a scenario describing their worst fear using the downward arrow technique, and recorded the scenario on a looped tape for repeated exposure. They then listened to the recording for 20 to 60 minutes (long enough to experience a decrease in anxiety) everyday and continued to "expose" themselves to the scenario until it no longer provoked anxiety (typically 10 to 15 exposure sessions). See Dugas and Robichaud (2007) for a detailed description of the CBT protocol.</p> <ul style="list-style-type: none"> ● <i>Dose</i>: Consisted of 12weekly 1-hour sessions. ● <i>Duration</i>: 12 weeks. <p>Control 2</p> <ul style="list-style-type: none"> ● <i>Description</i>: Waiting list |

Excluded criteria: The only exclusion criterion was ongoing psychosis. Pretreatment: Relevant tests revealed no significant (P<.05) differences between the two groups, though for personality disorder the P value was 0.051. 14/23 in the intervention group vs 7/22 in the control group had personality disorders</p> |
| <p>Interventions</p> | <p>Intervention Characteristics</p> <p>Intervention</p> <ul style="list-style-type: none"> ● <i>Description:</i> Thought field therapy (TFT). TFT intervention. In ordinary TFT practice, patients are offered a treatment package of five hours of individual therapy. The patients in the current study received only two sessions of individual therapy, the first one lasting up to 50 minutes, the other up to 25 minutes. The reason for giving such a short treatment was that the TFT therapist did not have time for a full treatment package, because he practices in another part of the country. Clinical experience has shown that such a short treatment may be sufficient. Additional sessions were provided by the first author, when judged as necessary. In the 12-month follow-up, 11 patients received no additional treatment by the first author, eight patients received one session, 14 patients received from two to five sessions, six patients received from six to 10 sessions, and six patients received from 11 to 23 additional sessions. The treatment was based on the TFT guidelines¹ and was conducted by an experienced TFT therapist. The treatment sessions were observed by the first author in order to ensure that the treatment given was TFT and that the treatment was provided in accordance with the study protocol, but no treatment fidelity instrument was applied ● <i>Duration:</i> 2.5 month <p>Control</p> <ul style="list-style-type: none"> ● <i>Description:</i> Waiting list |

Risk of bias table

| Bias | Authors' judgement | Support for judgement |
|---|--------------------|---|
| Random sequence generation (selection bias) | Low risk | Quote: "Patients were consecutively randomized based on a computer-generated list." |
| Allocation concealment (selection bias) | High risk | Quote: "The randomization procedure was not blinded. The whole procedure of inclusion, randomization, group-allocation and follow-up was performed by the principal investigator." |
| Blinding of participants and personnel (performance bias) | High risk | Judgement Comment: No information of blinding of health care providers, blinding of participants not feasible. |
| Blinding of outcome assessment (detection bias) | High risk | Quote: "Patients were consecutively randomized based on a computer-generated list. The randomization procedure was not blinded. The whole procedure of inclusion, randomization, group-allocation and follow-up was performed by the principal investigator." Judgement Comment: Blinding is not feasible, and outcomes are self-reported |
| Incomplete outcome data (attrition bias) | Low risk | Quote: "One patient in the immediate treatment group did not return after the first TFT treatment. Another patient in this group did not complete rating scales at the three- and 12- month follow-up. One patient in the group receiving TFT after the waiting period did not provide data at the 12 month follow-up. We used last observation carried forward for the missing data for these three patients (Figure 1)." Judgement Comment: Low number of dropouts. 2 in the TFT group and 1 in the waiting list group. Reasons for dropouts stated. |
| Selective reporting (reporting bias) | High risk | Quote: "Registration number NCT02022709, http://ClinicalTrials.gov ." Judgement Comment: Specifick symptoms scales were planned according to the protocol and the methods section. Because of changes in the inclusion criteria these symptom scales were omitted. Davidson Trauma Scale, Liebowitz Social Anxiety Scale, Fear Questionnaire (FQ) were planned in the protocol but not reported in the trial. |
| Other bias | Low risk | Judgement Comment: The study appears to be free from other sources of bias |

|---------------------|---|
| Methods | <p>Study design: Randomized controlled trial</p> <p>Study grouping: Parallel group</p> |
| Participants | <p>Baseline Characteristics</p> <p>Intervention</p> <ul style="list-style-type: none"> ● Female, n (%): 10 (66.67%) <p>Control</p> <ul style="list-style-type: none"> ● Female, n (%): 10 (66.67%) <p>Control 2</p> <ul style="list-style-type: none"> ● Female, n (%): 10 (66.67%) <p>Overall</p> <ul style="list-style-type: none"> ● Age, mean, SD: 37.42 (8.38) ● Female, %: 66.67% ● Years since onset, mean, SD: 9.0 (7.52) <p>Included criteria: - DSM-III-R (APA, 1987) criteria for panic disorder with agoraphobia;- be between 20 and 60 yr of age; - have no other psychiatric complaint in need of immediate treatment;- have no psychotic or organic symptoms;- if any medication was used the intake was to be held constant during the study;- not to receive any other kind of psychiatric or psychological treatment except for any ongoing medication during the treatment; and- express a willingness to participate in the study for a period of 3 months.</p> <p>Excluded criteria: Reasons for exclusion: Those excluded were either not phobic enough, ie. they had only a mild avoidance (n = 11), had social phobia as their primary problem (n = 6), or primary depression, i.e. the onset of the first depressive episode was earlier than the onset of the panic disorder (n = 2). One patient dropped out after two sessions due to time scheduling difficulties and was replaced.</p> <p>Pretreatment: ANOVAs on the self-report and behavioral measures at the pre-treatment assessment yielded no significant differences between the groups on any measure.</p> |

| | |
|-----------------------------|--|
| <p>Interventions</p> | <p>Intervention Characteristics Intervention</p> <ul style="list-style-type: none"> ● Description: All patients had self-exposure instructions which emphasized the importance of regular and prolonged exposure to the phobic situations. Applied relaxation (AR). During the first two sessions the treatment was described to the patient and a specific analysis concerning both anxiety-arousing aspects of the phobic situations and the patients psychological reactions was made. Early signs of arousal and anxiety, or the critical aspects of the phobic situations, were specified and used as cues for relaxation. The relaxation training started with progressive relaxation with tension-release of the muscles (Session 3). The short version (release only) was introduced during Session 4, and conditioned relaxation during Session 5. The latter was continued in Session 6, during which the patients also practised identifying early signs of anxiety. This was continued during Session 7 and here differential relaxation was introduced, which was continued during Session 8. In Session 9 the patients were taught rapid relaxation and practised applying their relaxation skills in stressful but nonphobic situations, while Sessions 10-11 were used for application training in natural agoraphobic situations. The 12th session was used for summary and maintenance instructions. Homework assignments: At the end of each session homework instructions were given for: (1) recording time spent away from home, kind of transportation used to arrive at that destination, if on their own or accompanied and a rating of anxiety experienced on a O-IO scale; (2) practice in the respective treatment conditions. In the AR condition different relaxation tasks were to be practiced every day for about 15-20 min. The AR group was to self-observe and record early signs of anxiety to make them more aware of these signs to use in their coping response ● Dose: 60 minutes once per week ● Duration: 12 sessions over a 3-month period. <p>Control</p> <ul style="list-style-type: none"> ● Description: All patients had self-exposure instructions which emphasized the importance of regular and prolonged exposure to the phobic situations. Cognitive treatment (CT). The treatment consisted of a combination of the Beck and Emery (1985) rationale for cognitive therapy in panic/agoraphobia, and the self-instruction training of Meichenbaum (1977). It resembled, but cannot be considered equal to the cognitive therapy developed by Clark (1986) for panic disorder. During the first two sessions the treatment and its rationale was described to the patient and a specific analysis concerning both anxiety-arousing aspects of, and the patients cognitive reactions in the phobic situations was made. As a homework assignment the patient was instructed to record, in a specific diary, negative thoughts while confronting phobic situations. Sessions 3 and 4 were devoted to developing positive self-instructions and cognitive coping procedures. During session 5 the self-instructions that the patient had found useful in natural phobic situations were summarized on an index card that the patient could carry with him/her at all times and use in future phobic situations. Sessions 6 and 7 were devoted to attribution training with the purpose of learning to recognize alternative explanations, besides anxiety, to various negative emotions. Sessions 8-10 consisted of continued cognitive restructuring of imagery and attitudes to one's phobic problems. Session 11 summarized the treatment and session 12 was devoted to describing the maintenance programme. Homework assignments: At the end of each session homework instructions were given for: (1) recording time spent away from home, kind of transportation used to arrive at that destination, if on their own or accompanied and a rating of anxiety experienced on a O-IO scale; (2) practice in the respective treatment conditions. This was done every day if possible, or at times agreed upon until the next session. The CT-group recorded their negative thoughts and the use of self-instructions and cognitive coping procedures when confronting phobic situations. ● Dose: 60 minutes once per week ● Duration: 12 sessions over a 3-month period. |

|----------------------|--|
| Methods | <p>Study design: Randomized controlled trial Study grouping: Parallel group</p> |
| Participants | <p>Baseline Characteristics Overall</p> <ul style="list-style-type: none"> ● Age, mean, SD: 32.6 (7.1) ● Female, n (%): 26 (72%) ● Years since onset, mean: 7.0 (5.7) <p>Included criteria: 1. DSM-III-R criteria for panic disorder with no or mild avoidance. 2. A duration of the panic disorder of at least 1 yr. 3. Be between 18 and 60 yr of age. 4. Having at least 3 panic attacks during the 3-wk baseline. 5. Not suffer from primary depression (i.e. onset before the start of the panic disorder). 6. Not suffer from any other psychiatric disorder in immediate need of treatment. 7. Panic disorder must be the patient's primary problem. 8. If on prescribed drugs for panic disorder: (a) the dosage had to be constant for 3 months before the start of the treatment; and (b) the patient had to agree to keep the dosage constant throughout the study. 9. Agreeing to take part in the study for 18 wk, including pre- and post-assessment, and 1-yr follow-up, and be willing to accept random allocation.</p> <p>Excluded criteria: Reasons for exclusion. In order to recruit the 38 patients that started treatment 160 referred patients went through the screening-interview and 122 (76.3%) of them were excluded. In 44 cases it turned out that the patients did not have a panic disorder; 18 had social phobia, 10 generalized anxiety disorder, 8 major depression, 2 simple phobia, 2 hypochondriasis, 2 psychosis and 2 adjustment disorder. A total of 78 out of the 122 excluded patients fulfilled criteria for panic disorder but were still excluded due to the following reasons: severe agoraphobic avoidance 22, too low panic frequency (<3 attacks during the baseline) 14, too short duration (<1 yr) 12, only limited symptom attacks 11, recently started pharmacotherapy for panic disorder 10, the panic disorder was in remission 5, a concurrent somatic disorder 2, and time scheduling problems 2. Personality disorders were not a reason to exclude patients from the study. However, since no formal assessment of personality disorders was made we cannot say anything about the frequencies.</p> <p>Pretreatment: The AR-group had higher means on the Hamilton Anxiety Scale [28.2 vs 22.1; t(34) = 3.07, P < 0.01] and the Body Sensations Questionnaire [53.6 vs 43.4; t(34)= 2.78, P < 0.01].</p> |
| Interventions | <p>Intervention Characteristics Intervention</p> <ul style="list-style-type: none"> ● Description: Applied relaxation (AR). During the first session the treatment was described to the patient and a specific analysis concerning both panic-eliciting situations and the patient's physiological reactions was made. Early signs of arousal and anxiety, or critical aspects of the panic situations, were specified and used as cues for relaxation. The relaxation training started with progressive relaxation with tension-release of the muscles (Sessions 2 and 3). The short version (release-only) was introduced during Session 4 and cue-controlled (conditioned) relaxation during Session 5. During Session 6 differential relaxation was introduced, and it was continued during Session 7. In Session 8 the patients were taught rapid relaxation and practised applying their relaxation skills in stressful but nonpanic situations, and this was continued during Session 9. Sessions 10-11 were used for application training in natural situations. Finally Session 12 was used for a review of the treatment and maintenance instructions. Between sessions the patients had homework assignments to carry out and record on specific forms. ● Dose: therapy sessions lasted 50-60 min and were scheduled once a week for a total of 12 sessions. ● Duration: 12 weeks <p>Control</p> <ul style="list-style-type: none"> ● Description: Cognitive Behavior Therapy (CBT). This method is based on the cognitive theory of panic (Beck et al., 1985; Clark, 1986) and makes use of both cognitive and behavioral techniques (Clark, 1989). The first step consists of identifying the misinterpretation of bodily sensations that is characteristic of the individual patient. The second step entails generating an alternative, non-catastrophic, interpretation of the sensations. In this phase it is important to use Socratic questioning in order for the patient him-/herself to come up with an alternative |

| | |
|------------------------------|---|
| | <p>explanation. The final step consists of testing the validity of these alternative hypotheses, which is done both with discussions to challenge the patient's evidence for their beliefs, and with behavioral experiments by inducing the very sensations that the patient misinterprets and prevent them from carry out safety behaviors. In this way the patients will gain factual knowledge concerning the feared consequences of their panic symptoms and eventually change their catastrophic misinterpretations. Between sessions the patients had homework assignments to carry out and record on specific forms.</p> <ul style="list-style-type: none"> ● Dose: therapy sessions lasted 50-60 min and were scheduled once a week for a total of 12 sessions. ● Duration: 12 weeks |
| <p>Outcomes</p> | <p><i>Grad af angst, HAM-A, mean final, SD</i></p> <ul style="list-style-type: none"> ● Outcome type: Continuous Outcome ● Reporting: Fully reported ● Scale: HAM-A ● Range: 0-56 ● Direction: Lower is better ● Data value: Endpoint <p><i>Funktion, Panic attack scale subscale distress/disability</i></p> <ul style="list-style-type: none"> ● Outcome type: Continuous Outcome ● Reporting: Not fully reported ● Scale: Panic attack scale subscale distress/disability ● Range: 0-63 ● Direction: lower is better ● Data value: Endpoint <p><i>Frafald, alle årsager</i></p> <ul style="list-style-type: none"> ● Outcome type: Adverse Event ● Reporting: Fully reported ● Direction: Lower is better ● Data value: Endpoint |

Risk of bias table

| Bias | Authors' judgement | Support for judgement |
|---|--------------------|--|
| Random sequence generation (selection bias) | Unclear risk | Judgement Comment: Insufficient information on sequence generation |
| Allocation concealment (selection bias) | Unclear risk | Judgement Comment: Insufficient information on allocation concealment |
| Blinding of participants and personnel (performance bias) | High risk | Judgement Comment: Blinding not feasible and outcome is self-reported |
| Blinding of outcome assessment (detection bias) | High risk | Quote: "Post-treatment assessment. Immediately after the last session the patient once more filled in the questionnaires, and went through a brief interview in which a shortened version of the ADIS-R (mainly including the Hamilton scales) was used." Judgement Comment: Blinding not feasible and outcome is self-reported |
| Incomplete outcome data (attrition bias) | Low risk | Quote: "Two patients, both in the AR-group, dropped out at an early stage of treatment due to scheduling difficulties." |
| Selective reporting (reporting bias) | Low risk | Judgement Comment: Insufficient information on study protocol, buta appears to report on all outcomes of interest |
| Other bias | Low risk | Judgement Comment: The study appears to be free from other sources of bias |

Ost 2000

| | |
|----------------------|---|
| Methods | <p>Study design: Randomized controlled trial</p> <p>Study grouping: Parallel group</p> |
| Participants | <p>Baseline Characteristics</p> <ul style="list-style-type: none"> ● Not reported. <p>Included criteria: 1. DSM-III-R (APA, 1987) criteria for generalized anxiety disorder. 2. A duration of the disorder of at least 1 year. 3. Be between 18±60 yr of age. 4. Not suffer from primary depression (i.e. onset before the start of the GAD). 5. Not suffer from any other psychiatric disorder in more need of treatment. 6. Generalized anxiety disorder must be the patient's primary problem. 7. If on prescribed drugs for anxiety disorder, (a) the dosage had to be constant for 3 months before the start of the treatment and (b) the patient had to agree to keep the dosage constant throughout the study. 8. Agreeing to take part in the study for 18 weeks, including pre- and post-assessment and 1 year follow-up and be willing to accept random allocation.</p> <p>Excluded criteria: Reasons for exclusion: In order to recruit the 36 patients that started treatment 68 patients went through the screening-interview and 24 (35%) of them were excluded, since they did not have GAD as their primary diagnosis. Ten had panic disorder, four social phobia, three obsessive-compulsive disorder, two major depression and one each had bipolar disorder, alcoholism and hypochondriasis, while two subjects did not fulfill any DSM-III-R diagnosis. Six of the 24 excluded patients fulfilled GAD-criteria as a secondary diagnosis. Personality disorders were not a reason to exclude patients from the study. However, since no formal assessment of personality disorders was made we cannot say anything about the frequencies. Besides the 36 patients who started treatment another eight subjects fulfilled the inclusion criteria but did not start treatment for various reasons; two started to take anxiolytic drugs while waiting for the first session, two became too depressed to participate in the treatment, two lived too far from Uppsala to come once a week for therapy and two did not show up after the screening-interview.</p> <p>Pretreatment:</p> |
| Interventions | <p>Intervention Characteristics</p> <p>Intervention</p> <ul style="list-style-type: none"> ● <i>Description:</i> During the first session the treatment was described to the patient and a specific analysis concerning both anxiety and worry eliciting situations and the patient's physiological reactions was made. Risk of bias table

| Bias | Authors' judgement | Support for judgement |
|---|--------------------|--|
| Random sequence generation (selection bias) | Unclear risk | Quote: "The patients were randomly assigned to two treatments," Judgement Comment: No info on randomization method Insufficient information on sequence generation |
| Allocation concealment (selection bias) | Unclear risk | Judgement Comment: Insufficient information on allocation concealment |
| Blinding of participants and personnel (performance bias) | High risk | Judgement Comment: Not feasible to blind the groups, and it is likely that the knowledge of group allocation will influence outcome |
| Blinding of outcome assessment (detection bias) | High risk | Judgement Comment: No info about blinding of individual assessors (relevant for HAM-A). All other outcomes are self-reported. |
| Incomplete outcome data (attrition bias) | Low risk | Quote: "Three patients, 2 in the AR-group (12%) and 1 in the CT-group (5%) dropped out at an early stage of treatment. The dropouts did not differ significantly from the completers on any demographic or pre-treatment measures." Judgement Comment: Sparse information about number of participants allocated to each group. |
| Selective reporting (reporting bias) | Low risk | Judgement Comment: No pre-specified protocol however, comprehensive reporting of outcome results specified in methods. |
| Other bias | Low risk | Judgement Comment: The study appears to be free from other sources of bias |

Song 2014

| Methods | <p>Study design: Randomized controlled trial</p> <p>Study grouping: Parallel group</p> |
| Participants | <p>Baseline Characteristics</p> <p>Intervention</p> <ul style="list-style-type: none"> ● Mean age, years (SD): 65.3 (7.1) <p>Control</p> <ul style="list-style-type: none"> ● Mean age, years (SD): 66.1 (8.3) <p>Included criteria: The patients suffered from anxiety disorder at the ages of 60-75 years old. The patients meet the diagnostic criteria for anxiety disorder in Chinese Classification and Diagnostic Criteria of Mental Disorders (The third version) (CCMD-3) and their Hamilton Anxiety Scale (HAM-A) evaluation scores.</p> |

Excluded criteria: Exclude and merge these patients who suffer from other mental disorders, severe organic diseases and severe somatic diseases.
Pretreatment: No significant baseline differences

Interventions

Intervention Characteristics

Intervention

- **Description:** Tai Chi and Paroxetine. The experimental group: the therapy combining the oral drug with Tai Chi exercise. The patients in the experimental group are same with those in the control group and they are treated by the drugs, besides they do Tai Chi exercise for 35 minutes respectively at morning and at evening. Each exercise is divided into two parts. The first part is preparation for exercise: Chen Style Tai Chi-activity of all joints in the whole body. This part focuses on the stretching exer-cise and practice for all joints from top to bot-tom and from hand to foot; the second part is 18 essences of Chen Style Tai Chi. These 18 essences are the core of Chen Style Tai Chi and it integrates 18 postures required by the modern fitness training. The entire postures integrate motion and quietness and it is easy for the old people to learn and practice.
 - **Dose:** Tai Chi exercise for 35 minutes respectively at morning and at evening. Paroxetine two times pr. day 10mg/time
 - **Duration:** 45 days
- Control
- **Description:** Paroxetine. The control group: it is only treated by oral drug. Drug name: Paroxetine (Produced by Tianjin TSKF Pharmaceutical Company Limited, the trade name "Seroxat".
 - **Dose:** Paroxetine two times pr. day 10mg/time.
 - **Duration:** 45 days

Outcomes

Grad af angst, HAM-A, mean SD

- **Outcome type:** Continuous Outcome
 - **Reporting:** Fully reported
 - **Scale:** HAM-A
 - **Range:** 0-56
 - **Direction:** Lower is better
 - **Data value:** Endpoint
- Funktion, Adopt Generic Quality of Life Inventory-74 (GQOLI-74)- subscale psychological functioning, mean, SD*
- **Outcome type:** Continuous Outcome
 - **Reporting:** Fully reported
 - **Scale:** Adopt Generic Quality of Life Inventory-74
 - **Range:** 0-70
 - **Direction:** Higher is better
 - **Data value:** Endpoint

Livskvalitet, Adopt Generic Quality of Life Inventory-74 (GQOLI-74)- subscale general life quality, mean, SD

- **Outcome type:** Continuous Outcome

Data and analyses

1 Kropsterapi vs active control

| Outcome or Subgroup | Studies | Participants | Statistical Method | Effect Estimate |
|---|---------|--------------|---|--------------------|
| 1.1 Grad af angst (severity of anxiety) | 7 | 264 | Std. Mean Difference (IV, Random, 95% CI) | 0.06 [-0.24, 0.37] |
| 1.2 Funktionsniveau (function) | 4 | 178 | Std. Mean Difference (IV, Random, 95% CI) | 0.45 [0.07, 0.84] |
| 1.3 Livskvalitet (quality of life) | 1 | 22 | Mean Difference (IV, Fixed, 95% CI) | 0.40 [-0.69, 1.49] |
| 1.4 Grad af undgåelse (avoidance) | 4 | 134 | Std. Mean Difference (IV, Random, 95% CI) | 0.12 [-0.50, 0.75] |
| 1.5 Frafald, alle årsager (dropouts, all causes) | 8 | 391 | Risk Ratio (M-H, Random, 95% CI) | 1.78 [1.16, 2.74] |
| 1.6 Antal personer med skadesvirkninger (SAE og AE) Numbers with adverse events | 2 | 150 | Risk Ratio (M-H, Random, 95% CI) | 6.23 [0.67, 57.99] |
| 1.7 Bedring (response) | 4 | 238 | Risk Ratio (M-H, Random, 95% CI) | 0.69 [0.54, 0.88] |

2 Kropsterapi vs no treatment

| Outcome or Subgroup | Studies | Participants | Statistical Method | Effect Estimate |
|--|---------|--------------|---|----------------------|
| 2.1 Grad af angst (anxiety severity) | 4 | 139 | Std. Mean Difference (IV, Random, 95% CI) | -1.32 [-1.88, -0.77] |
| 2.2 Funktion (function) | 5 | 193 | Std. Mean Difference (IV, Random, 95% CI) | -0.83 [-1.18, -0.49] |
| 2.3 Livskvalitet (quality of life) | 1 | 32 | Mean Difference (IV, Fixed, 95% CI) | 3.80 [-0.80, 8.40] |
| 2.4 Grad af undgåelse (avoidance) | 1 | 41 | Mean Difference (IV, Fixed, 95% CI) | -1.53 [-2.24, -0.82] |
| 2.5 Frafald, alle årsager (dropouts, all causes) | 4 | 166 | Risk Ratio (M-H, Random, 95% CI) | 2.92 [0.68, 12.53] |
| 2.8 Bedring (response) Risk diff analyse | 1 | 41 | Risk Difference (M-H, Fixed, 95% CI) | 0.38 [0.17, 0.59] |
| 2.9 Bedring (response) relative risk analyse | 1 | 41 | Risk Ratio (M-H, Fixed, 95% CI) | 16.23 [1.00, 263.88] |

Risk of bias summary: review authors' judgements about each risk of bias item for each included study.

Figure 2 (Analysis 1.1)

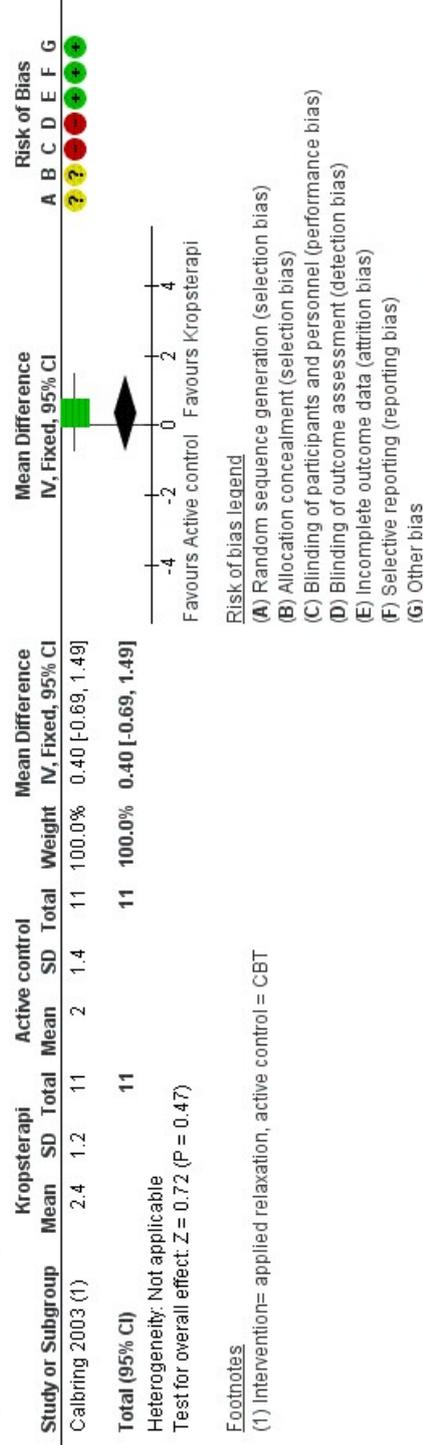

Forest plot of comparison: 1 Kropsterapi vs active control, outcome: 1.1 Grad af angst (severity of anxiety).

Figure 3 (Analysis 1.2)

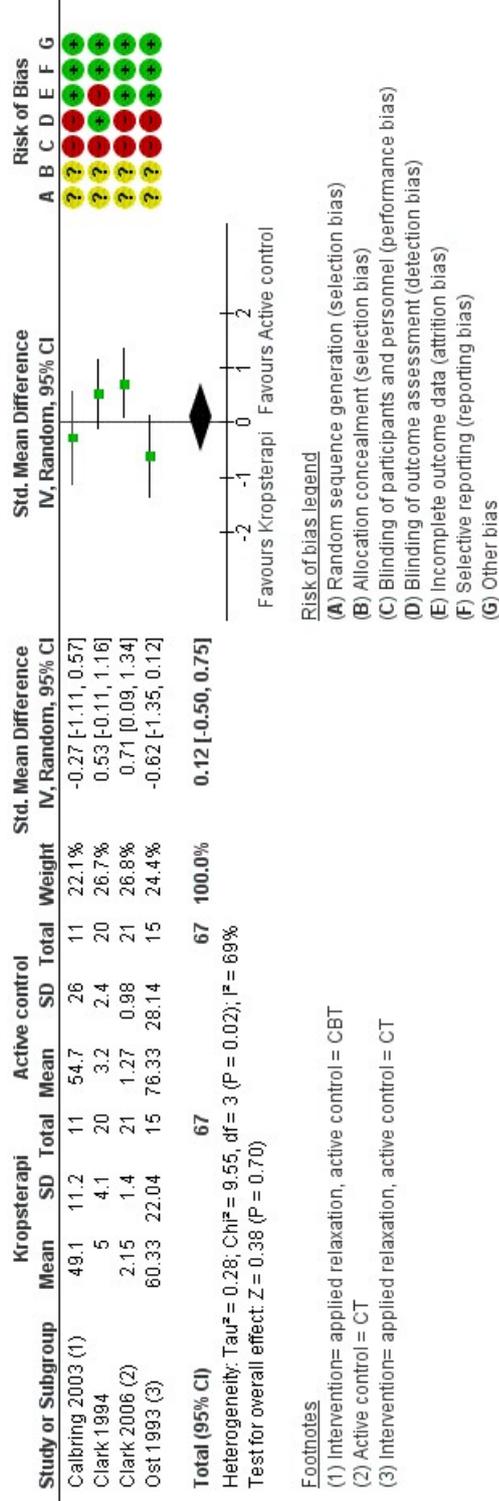

Forest plot of comparison: 1 Kropsterapi vs active control, outcome: 1.2 Funktionsniveau (function).

Figure 4 (Analysis 1.3)

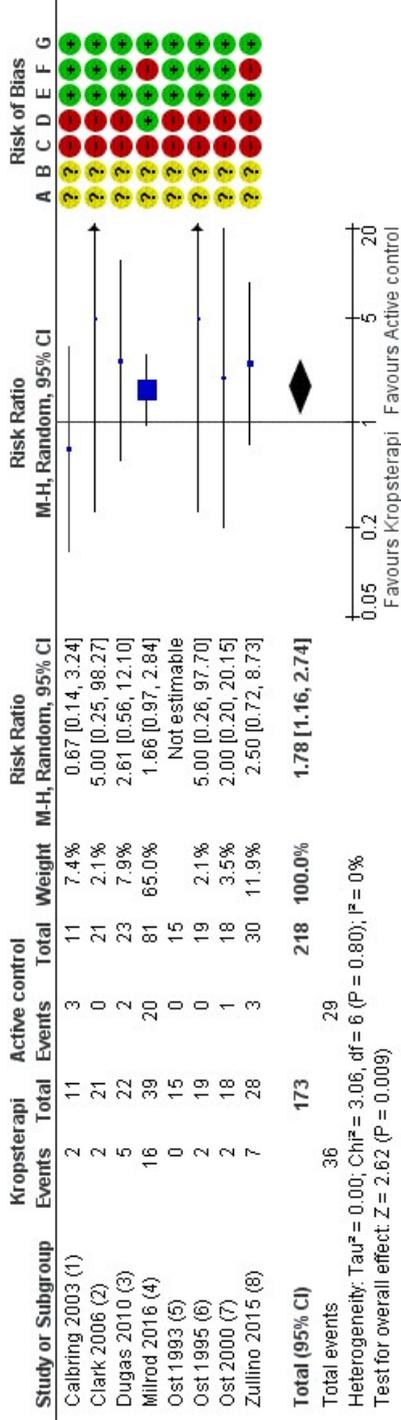

Forest plot of comparison: 1 Kropsterapi vs active control, outcome: 1.3 Livskvalitet (quality of life).

Figure 5 (Analysis 1.4)

Forest plot of comparison: 1 Kropsterapi vs active control, outcome: 1.4 Grad af undgåelse (avoidance).

Figure 6 (Analysis 1.5)

Footnotes

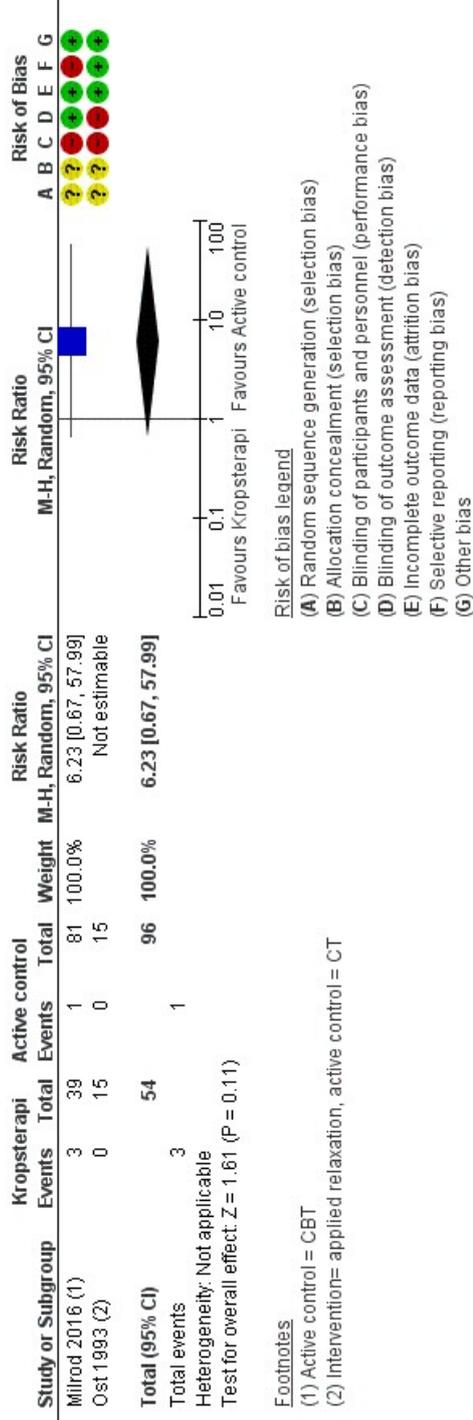

- (1) Intervention= applied relaxation, active control = CBT
- (2) Active control = CT
- (3) Intervention= applied relaxation, active control = CBT
- (4) Active control = CBT
- (5) Intervention= applied relaxation, active control = CT
- (6) Intervention= applied relaxation, active control = CBT
- (7) Intervention= applied relaxation, active control = CT
- (8) Intervention= applied relaxation, active control = Venlafaxine

Risk of bias legend

- (A) Random sequence generation (selection bias)
- (B) Allocation concealment (selection bias)
- (C) Blinding of participants and personnel (performance bias)
- (D) Blinding of outcome assessment (detection bias)
- (E) Incomplete outcome data (attrition bias)
- (F) Selective reporting (reporting bias)
- (G) Other bias

Forest plot of comparison: 1 Kropsterapi vs active control, outcome: 1.5 Frafald, alle årsager (dropouts, all causes).

Figure 7 (Analysis 1.6)
